# Configuring an Outgoing Email Server

- Most production deployments of Alfresco will require an outgoing SMTP server to be configured
- This SMTP server will be used by Alfresco for sending things like invites, activities updates, and task assignments
- Update **alfresco-global.properties** as follows (port is optional if SMTP server is running on 25):
  - mail.host=yourmailhost.com
  - mail.port=25
  - mail.username=username
  - mail.password=password
