

CIFS

A bit trickier than WebDAV and FTP

CIFS - Exercise - Windows only

Map a drive in Windows to Alfresco

- Do first **nbtstat -an <hostname>** to figure out if Windows File and Printer sharing is running,
 - If it is then it will clash with Alfresco CIFS server (netbios service 20)
 - **Turn off File & Printer sharing** (from network card protocols), restart machine
- Login via share: **\\<hostname>A\Alfresco**
 - Or use in network login username = \<IP>\<alfresco user>

CIFS - Exercise - Windows only - cont.

- If you cannot login via standard network login dialog use **net use** (because of domain):
 - **net use Z: \\<IP>\Alfresco <password> /USER:<username>**
 - **Note.** If logged in as admin in console, the drive will only be available in this console window
 - **Note.** If you have a VM installed you might have to disable all the Network drive stuff
